# *Legal Partitions*

- $G = (V, E)$  – digraph
- $V$  – set of students
- $E$  – preferences:
  - $u \rightarrow v \in E \implies u$  wants to be with  $v$

# *Legal Partitions*

- $G = (V, E)$  – digraph

## **Definition.**

Let  $V = V_1 \cup \dots \cup V_k$  be a partition of  $V$  into  $k$  nonempty parts.  
The partition is called legal if

$$(\forall V_i)(\forall v \in V_i): \text{outdeg}_{V_i}(v) \geq 1$$

- So, we partition to  $k$  classes such that each student has at least 1 friend in each class

# *Existence of Legal Partitions*

**Theorem** [Thomassen 1983].

Let  $G = (V, E)$  be a graph such that each vertex has outdegree at least 3. Then, there exists a legal partition  $V = V_1 \cup V_2$ .

- Theorem is tight:

# *Thomassen's Theorem*

**Proof** [Overview].

- Constructive proof
- WLOG assume the outdegree of each vertex is exactly 3
- Two steps
  1. Find two disjoint cycles (interesting part)
  2. Extend the two cycles to the desired partition (easy part)

# *Extending Disjoint Cycles to a Legal Partition*

Let  $C_1, C_2$  denote the disjoint cycles obtained in Step 1.

Consider a maximal legal extension  $C_1 \subseteq V_1, C_2 \subseteq V_2$ .

We claim that  $V = V_1 \cup V_2$  (and hence a legal partition)

Indeed, if  $\exists v \notin V_1 \cup V_2$  then consider any maximal path starting at  $v$

If this path reaches  $V_1$  or  $V_2$  at some point then add the corresponding prefix to  $V_1$  or  $V_2$  accordingly

Else, add the entire path to  $V_1$  or  $V_2$  arbitrarily

# *Q1: How Many Legal Partitions Are There?*

## Question 1.

Let  $t(d, n)$  denote the minimum number of non-trivial legal partitions of a digraph with  $n$  vertices and minimum outdegree  $\geq d$ . Provide upper and lower bounds on  $t(d, n)$ .

- $t(2, n) = 0$
- $t(3, n) \geq 1$
- $\lim_{n \rightarrow \infty} t(3, n) = \infty$  ???
- How about  $t(d, n)$  for larger  $d$ 's?

\\Thomassen Theorem

## ***Q2: Can Any Pair of Vertices Be Separated Legally?***

### **Question 2.**

Let  $G = (V, E)$  be a graph so that each vertex has outdegree at least 3 and let  $u, v \in V$  be distinct. Does there exist a legal partition  $V = V_1 \cup V_2$  such that  $u \in V_1, v \in V_2$ ???

- An affirmative answer implies  $t(3, n) \geq \lfloor \log n \rfloor$
- How about when we assume a larger outdegree?
  - Constant?
  - Some function of  $n$ ?
